

AI Dentist SOP Starter Pack

Starter SOPs, workflow templates, and checklists for dental teams adopting AI tools — by Dr. Pascal Nguyen, DMD, NMD / PJN Dental

These templates are educational and business workflow resources. They are not legal, financial, medical, clinical, regulatory, or HIPAA compliance advice. Adapt all templates to your jurisdiction, practice policies, and professional standards.

1. AI Use-Case Inventory Worksheet

Use this worksheet once per quarter to map every AI tool your team is using or considering. The goal is one clear list of approved use cases, responsible owners, and any outstanding review gaps.

How To Complete

- 1. List every AI tool currently in use (include free tools and browser extensions).
- 2. For each tool, identify the task category: admin, marketing, scheduling, documentation support, or other.
- 3. Mark whether each use involves protected health information (PHI). Any PHI use requires a separate HIPAA review — consult your compliance officer.
- 4. Assign one owner per tool — the team member accountable for appropriate use.
- 5. Flag gaps: tools with no owner, no use-case boundary, or no review process.

Inventory Table

AI Tool	Task Category	PHI Involved?	Owner	Approved Use Cases	Review Gap
Example: ChatGPT	Marketing drafts	No	Front desk lead	First-draft patient education posts	Not reviewed before publishing
Example: Whisper	Meeting notes	No	Office manager	Transcribing non-patient team meetings	None
[Add your tool]					
[Add your tool]					
[Add your tool]					

Review this table with your team lead at least once per quarter. Remove any tool that cannot be assigned a clear owner and approved use case.

2. Team Workflow SOP Templates

Use these three templates as starting points. Copy, adapt, and save in your practice's internal documentation system.

SOP Template A — AI-Assisted Content Draft Review

PURPOSE

Ensure all AI-drafted content passes a human review before use in any patient-facing, public, or internal channel.

TRIGGER

Any time an AI tool produces text, images, or summaries intended for use by the practice.

STEPS

1. Request the draft using an approved prompt from the Prompt Safety and Review Checklist (Section 3).
2. Read the output in full before using or sharing.
3. Check against the Human Review Standard below.
4. Edit or reject any content that fails a check.
5. Save the approved final version in the designated folder.
6. Log the task: tool used, task category, reviewer initials, date.

HUMAN REVIEW STANDARD

- No diagnosis, clinical recommendation, or treatment instruction.
- No guarantee of outcome, cure, or reversal.
- No representation as professional, legal, or compliance advice.
- No patient-identifying information in any AI input.
- Tone is clear, warm, and non-alarming.
- Any factual claim has a source the reviewer can verify.

OWNER

Designated team member (assign one name, not a role category).

SOP Template B — New AI Tool Adoption

PURPOSE

Create a consistent approval gate before any new AI tool is used by the team, even for a trial.

STEPS

1. Identify the tool and the specific task it will support.
2. Check: does this tool require patient data? If yes, STOP — escalate to your compliance officer.
3. Identify a limited trial scope: one person, one task, two weeks.
4. Add the tool to the AI Use-Case Inventory Worksheet.
5. Assign an owner and define approved use cases before the trial starts.

6. Review after two weeks: approve, modify scope, or remove.

SOP Template C — AI Output Escalation

PURPOSE

Define what to do when AI output is unclear, potentially inaccurate, or touches a sensitive area.

ESCALATION TRIGGERS

- Output includes clinical-sounding language (symptoms, diagnoses, medications).
- Output references a specific patient, even if only by context.
- Output makes a regulatory or compliance claim.
- Reviewer is unsure whether the output is accurate.

STEPS

1. Do not use or share the output.
2. Flag the output for the tool owner.
3. The owner reviews and either clears, edits, or discards.
4. If the output involves PHI or a clinical claim, escalate to the practice lead immediately.
5. Log the escalation: date, tool, task, resolution.

3. Prompt Safety and Review Checklist

Use this checklist every time you write a prompt for an AI tool. A safe prompt produces safer output and reduces review time downstream.

Before You Write The Prompt

- Confirm the task does not require entering any patient-identifying information.
- Confirm the task falls within an approved use category (see Inventory Worksheet).
- Confirm you are using an approved tool.

Prompt Construction Checklist

Prompt Element	Guideline	Why It Matters
Task description	State what you need clearly and specifically.	Vague prompts produce unpredictable output.
Audience	Name the intended reader (e.g., 'a dental patient with a just-in-time background').	Adjusts tone and complexity to the audience you specify.
Tone boundary	State if you want warm, professional, or educational.	Helps avoid output that could cause patient anxiety.
Content boundary	Include: 'Do not include diagnosis, clinical advice, or guaranteed outcomes.'	Reduces the chance of unsafe clinical-sounding language.
Review instruction	End with: 'This is a first draft for human review.'	Signals that the output is a starting point, not a final product.

After You Receive The Output

1. Read the full output before using any part of it.
2. Run the Human Review Standard from SOP Template A.
3. Edit or reject anything that fails.
4. Save approved output with the log entry (tool, task, reviewer, date).

Prompt Templates You Can Copy

ADMIN TASK PROMPT

Create a [type of document — e.g., checklist / SOP outline / meeting agenda] for a dental practice team. The audience is non-clinical admin staff. Keep the tone professional and clear. Do not include clinical, medical, legal, or HIPAA compliance advice. This is a first draft for human review and editing.

EDUCATIONAL CONTENT PROMPT

Write a patient-friendly educational post about [TOPIC] for a dental practice. Tone: warm, clear, non-alarming. Do not include diagnosis, treatment recommendations, or guaranteed outcomes. Use language like 'may,' 'can,' or 'is associated with' where appropriate. Include a reminder to discuss individual concerns with a dental or medical professional. This is a first draft for human review before publishing.

Quick Reference — Approved vs. Not Approved

Approved	Not Approved Without Additional Review
Drafting internal admin checklists	Entering patient names or health data into any AI tool
Creating first-draft educational content	Generating diagnosis, treatment, or medication instructions
Summarizing non-patient team meetings	Publishing any AI output without human review
Organizing recurring admin workflows	Representing AI output as professional or legal advice
Drafting practice policy outlines	Using unapproved tools on any patient-facing task
